

Incident Report Analysis Demo-ICMP ATTACK

Summary	This evening several employees reported they were not able to access several network programs. These programs included software programs used for graphic design creation, employee email, Teams, and customer accounts. After reviewing data logs it appears that a malicious actor sent a flood of ICMP pings to the company's network through an unconfigured firewall. The network security team responded by blocking incoming ICMP packets, stopping all non-critical network services offline and restoring critical network services. The incident took approximately two hours to resolve.
Identify	After a thorough audit of all devices and policies, the security team found that the firewall was not configured, this allowed the malicious actor to access the company's network and flood it with ICMP packets to the network server. The security team suspects this was a Distributed Denial of Service Attack where multiple devices were used to flood the network.
Protect	In response to the incident our team implemented a new firewall rule to limit the rate of incoming ICMP packets. An IDS/IPS system was also installed to filter out some ICMP traffic based on suspicious characteristics.

Detect	To detect any suspicious intrusions, the team implemented an IDS/IPS system to filter out some ICMP traffic based on the packet's characteristics. In addition we also implemented a Source IP address verification on the firewall to check for spoofed IP addresses on incoming ICMP packets, along with network monitoring software to detect abnormal traffic patterns.
Respond	In the future our team will respond to such incidents by blocking all incoming ICMP packets, stopping all non critical network services offline and restoring critical network services. Our team will analyze all log data within the network to identify any suspicious activity.
Recover	Upon containing the incident, all employees and customers were notified of the delay in services and the ETA was approximately 2 hours until all resolved. Customer accounts, employee emails and software programs were all restored. All non-critical network services were resumed as well. Traffic as usual continued after the firewall was configured and new rules were set.
